WRITTEN COMMUNICATION OF INTERNATIONAL SEARCHING AUTHORITY

International Application No. PCT/RU 2004/000117

Novelty (N) Claims 1	V. Reasoned statement under Rule 43 bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement					
Inventive step (IS) Claims 1 YES Claims NO Industrial applicability (IA) Claims 1 YES Claims NO Claims NO Claims NO Claims NO Claims NO 2. Citations and explanations supporting such statement: References cited in the Search Report: D1 RU 217285 C1, D2 SU 582373 A, D3 SU 874952 A, D4 RU 2027843 C1, D5 US 3171503 A, The prior art most relevant to the claimed device is D1. Known from D1 is a borehole reamer comprising a body with inclined grooves and a central pass in which a rod is disposed, spring-biased toward a lower end of the body, legs with journals on which cutters are fitted secured in the inclined grooves of the body, and supports in which free ends of the leg journals are secured, the supports interacting with the rod with the aid of pushers. The claimed device differs from D1 in that the pushers of the supports are made as cylindrical pistons disposed in inclined bores of the body and sealed with respect to its pass and the environment, one end of each pusher being connected to the support and the other end of each pusher being secured on the rod with the possibility of moving radially relative to the walls thereof, the central pass of the body communicating with the environment via openings which are made in the walls of the body and in the rod and are shut off when the legs with the cutters are advanced into the working position in order to enhance the efficiency and reliability of the reamer. These distinctive features are not known from the prior art and are not obvious to a person skilled in the art. Consequently, the claimed borehole reamer meets the criteria of "novelty", "inven-

D5-US 3171503 A

Наиболее близким аналогом к заявленному устройству является D1.

Из D1 известен расширитель скважин, содержащий корпус с наклонными пазами и центральным проходным каналом, в котором размещен шток, подпружиненный в сторону нижнего конца корпуса, закрепленные в наклонных пазах корпуса лапы с цапфами, на которых установлены шарошки, и опоры, в которых расположены свободные концы цапф лап, взаимодействующие со штоком с помощью толкателей.

Заявленное устройство отличается от известного D1тем, что толкатели опор выполнены в виде размещенных в наклонных сверлениях корпуса и уплотненных относительно его проходного канала и внешней среды цилиндрических поршней, одни концы которых соединены с опорами, а другие зафиксированы на штоке с возможностью радиальных перемещений относительно его стенок, причем центральный проходной канал корпуса сообщен с внешней средой отверстиями, выполненными в стенках корпуса и штока, перекрываемыми при выдвижении лап с шарошками в рабочее положение, чтобы повысить работоспособность и надежность расширителя.

Эти отличительные признаки не известны из предшествующего уровня техники и не являются очевидными для специалиста.

Следовательно, заявленный расширитель скважин соответствует критериям «новизны», «изобретательского уровня» и «промышленной применимости».
